

However, any changes that have been made to the remote repository since the last time you synced your local repository will not be present in the local repository until you fetch those changes

The working directory is a directory on your machine where you can edit and modify the files that are stored in the local repository.

When you make changes to the files in the working directory, these changes are not immediately reflected in the local repository. You need to push them to the remote repository in order to save them

The working directory is a directory on your local machine where you modify the files in the local repository.

The working directory should contain all the files that are present in the local repository, plus any changes that you have made locally.
